# Outline

- Background on Reporting Greenhouse Gas (GHG) Emissions
- Analysis of EPA Equation
- Discussion of Alternate Method
- Analysis of Alternate Method as Confirmational Tool
- Analysis of Alternate Method as Predictive Tool
- Comparison of Alternate Model to Existing EPA Equation

TRIMERIC CORPORATION

 noble  
energy

# Background

- EPA Mandatory Greenhouse Gas Reporting Rule

- 40 CFR 98 Subpart W: Petroleum and Natural Gas Systems

- Includes emission estimation methodologies and reporting requirements

- GHG emissions include  $N_2O$ ,  $CH_4$  and  $CO_2$  during flow back after hydraulic fracturing

- Hydraulic Fracturing: Fracturing rock using pressurized liquid to stimulate a well to maximize oil and gas extraction

- Flowback: Process of removal of spent fluids (wastewater, produced water, etc.) prior to well production

# Existing EPA Methodology (1 of 2)

- Option 1: Measure and record GHG emissions from each fractured well
- Option 2: Measure and record GHG emissions from subset of wells, and extrapolate to other wells
  - Measurements cost on the order of \$ 5,000 per day at each site
- Option 3: Calculate emissions in lieu of performing measurements

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Existing EPA Methodology (2 of 2)

- Option #3: EPA Equations W-11A and W-11B
- Subsonic Flow (W-11A)

$$FR_a = 1.27 \times 10^5 * A * \sqrt{3430 * T_u * \left[ \left( \frac{P_2}{P_1} \right)^{1.515} - \left( \frac{P_2}{P_1} \right)^{1.758} \right]}$$

- Sonic Flow (W-11B)

$$FR_a = 1.27 \times 10^5 * A * \sqrt{187.08 * T_u}$$

- Both equations calculate an actual volumetric gas rate
- Assume sonic flow applies ( $P_1/P_2 > 2$ ) and use Eq. W-11B

 noble  
energy

# Why Explore Alternatives to EPA Equations?

- EPA Equations
  - Appear to be derived from ideal gas law
  - Assume single-phase, methane gas
- Flowback following hydraulic fracturing
  - Multiple fluid phases (gas, oil, water)
  - Variable flow rate
  - Variable composition
- Result: EPA Equation W-11B typically overestimates GHG emissions

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Alternative: Empirically Derived Relationships

- Gilbert-type Correlation (1954)
  - Multiphase flow through wellhead choke
  - General form

$$P = \frac{c * Q_L * R^a}{S^b}$$

$P$  = upstream pressure (psia)

$Q_L$  = gross liquid rate (barrels per day)

$R$  = gas to liquid ratio (Mscf/bbl)

$S$  = choke size (1/64" increments)

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Empirical Data Analysis

- Step 1: Collect measured data for upstream pressure, choke size, and oil, water and gas production rates
- Step 2: Convert Gilbert-type correlation to linear form

$$\ln(P) - \ln(Q_L) = \ln c + a * \ln(R) - b * \ln(S)$$

- Step 3: Solve for a/b/c coefficients using multivariable linear regression
- Step 4: Rearrange and solve for gas rate

$$Q_G = Q_L * \left( \frac{P * S^b}{c * Q_L} \right)^{1/a}$$

- Step 5: Compare measured gas rate to calculated gas rate

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

noble energy

# Site-Specific Data Collection

- 13 total flowback operations
  - Ten high flow rate operations
  - Three low flow rate operations
- Measured data recorded hourly
  - Tubing pressure, choke size, cumulative gas/oil/water produced
- Removed periods of atypical operation from analysis

TRIMERIC CORPORATION

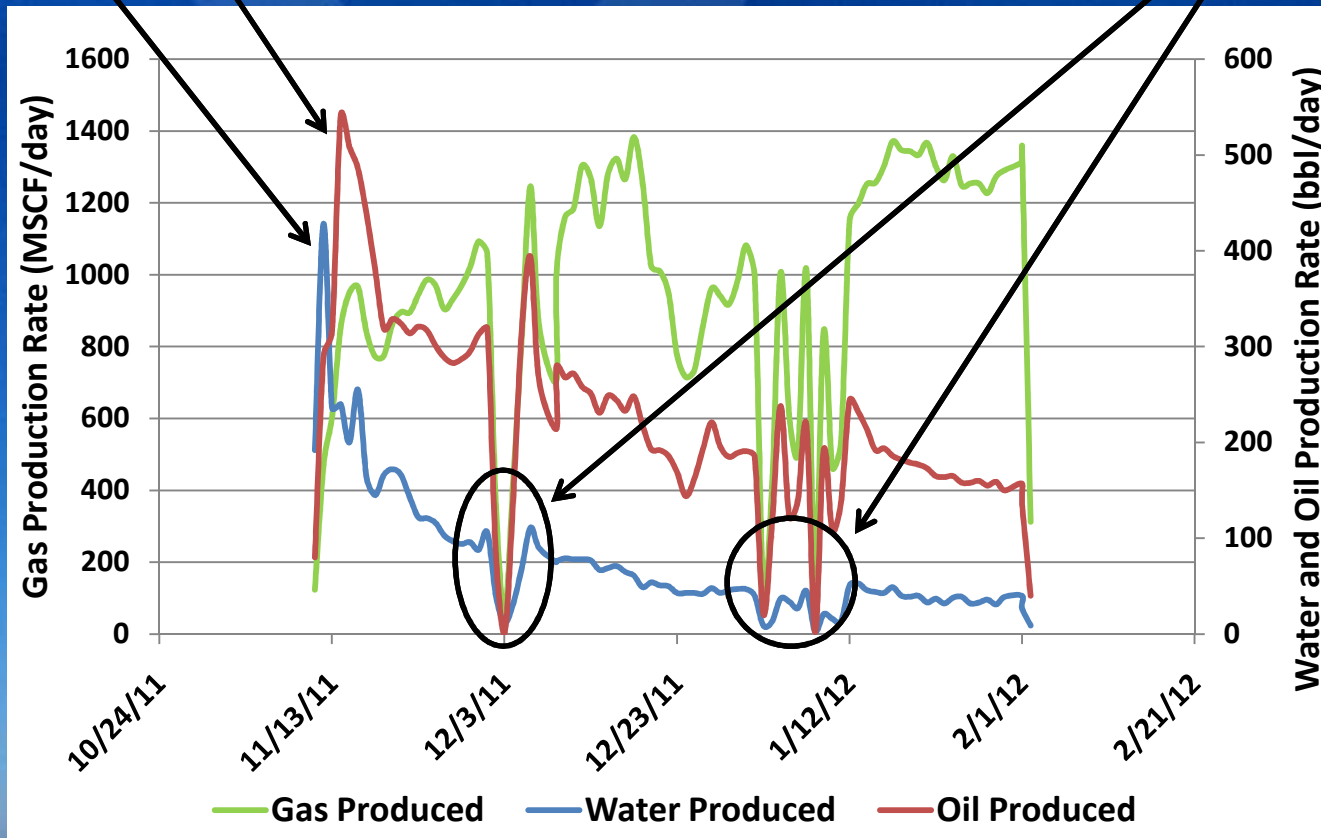

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Atypical Operation: Examples

No multiphase flow

No flow

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

# Analysis of Site-Specific Data

- Calculate seven-day averages for collected data
  - Tubing pressure (psia)
  - Choke size (1/64" increments)
  - Daily gas production (Mscf/day)
  - Daily water production (bbl/day)
  - Daily oil production (bbl/day)
- Calculate gas to oil ratio, gross liquid rate for seven-day averages
- Regress data to calculate a/b/c coefficients and compare calculated gas production to measured gas production

TRIMERIC CORPORATION

 noble  
energy

# Results of Site-Specific Data Analysis

Site	Measured Cumulative Gas Volume (MMscf)	Predicted Cumulative Gas Volume Site-Specific Correlation (MMscf)	Error (%)
Noble Well 1	81	88	9
Noble Well 2	100	97	-2
Noble Well 3	58	58	-1
Noble Well 4	27	29	7
Noble Well 5	37	41	9
Noble Well 6	79	79	0
Noble Well 7	144	149	4
Noble Well 8	62	66	7
Noble Well 9	59	66	12
Noble Well 10	47	49	3
<b>Field Total / Error Value</b>	<b>694</b>	<b>722</b>	<b>4</b>

- Gilbert-type correlation provided excellent results when using site-specific coefficients
- Valid for use as confirmational tool

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

# Extend Analysis to Entire Field

- Analysis of site-specific data only confirms that the correlation is valid when using site-specific coefficients
- Analysis of field-wide data was necessary to assess accuracy of correlation as predictive tool for other wells in the same field

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Analysis of Field-Wide Data

- Created composite data set of seven-day averages from ten long-term flowback operations
- Regressed one single set of a/b/c coefficients using data from all ten, high flow rate wells

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

 noble  
energy

# Results of Field-Wide Data Analysis

Site	Measured Cumulative Gas Volume (MMscf)	Predicted Cumulative Gas Volume Field-Wide Correlation (MMscf)	Error (%)
Noble Well 1	81	100	24
Noble Well 2	100	92	-8
Noble Well 3	58	46	-20
Noble Well 4	27	20	-25
Noble Well 5	37	36	-3
Noble Well 6	79	89	12
Noble Well 7	144	130	-9
Noble Well 8	62	75	21
Noble Well 9	59	84	43
Noble Well 10	47	46	-3
<b>Field Total / Error Value</b>	<b>694</b>	<b>718</b>	<b>3</b>

- Using field-regressed coefficients is satisfactory
- More variability with field-wide than site-specific coefficients

[www.trimeric.com](http://www.trimeric.com)

# EPA Equation W-11B

- Equation W-11B calculates emissions as a function of average upstream temperature and choke size
- Equation W-11B has a consistent, high bias compared to measured emissions

Site	Cumulative Measured Gas Volume (MMscf)	EPA Eq. W-11B (MMscf)	EPA Eq. W-11B Error (%)
Noble Well 1	81	188	133
Noble Well 2	100	177	78
Noble Well 3	58	94	61
Noble Well 4	27	59	118
Noble Well 5	37	77	106
Noble Well 6	79	177	123
Noble Well 7	144	214	49
Noble Well 8	62	152	144
Noble Well 9	59	145	145
Noble Well 10	47	90	89
<b>Field Total / Error Value</b>	<b>694</b>	<b>1373</b>	<b>98</b>

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

# Comparison of Empirical Methods with Equation W-11B

Site	Measured Cumulative Gas Volume (MMscf)	Predicted Cumulative Gas Volume Site-Specific Correlation (MMscf)	Predicted Cumulative Gas Volume Field-Wide Correlation (MMscf)	EPA Eq. W-11B (MMscf)
Noble Well 1	81	88	100	188
Noble Well 2	100	97	92	177
Noble Well 3	58	58	46	94
Noble Well 4	27	29	20	59
Noble Well 5	37	41	36	77
Noble Well 6	79	79	89	177
Noble Well 7	144	149	130	214
Noble Well 8	62	66	75	152
Noble Well 9	59	66	84	145
Noble Well 10	47	49	46	90
<b>Field Total</b>	<b>694</b>	<b>722</b>	<b>718</b>	<b>1373</b>

- Empirical method was consistently more accurate than EPA Equation W-11B for these data

TRIMERIC CORPORATION

[www.trimeric.com](http://www.trimeric.com)

# Summary

- Gilbert-type correlation can be used to predict overall volume of gas produced during flowback operations
- Gilbert-type correlation was sufficiently accurate at site-specific and field-wide levels
  - Variables required: choke size, tubing pressure, total produced liquid
- Gilbert-type correlation is more complicated than Equation W-11B
  - Requires linear regression
  - Requires engineering judgment to exclude data from periods of atypical operations
- EPA Equation W-11B consistently overestimated overall volume of gas produced for the wells studied
- Predictive correlation should be tested and validated using data from other formations to confirm its applicability in other formations and fields
