A photograph of several large, cylindrical industrial storage tanks made of light-colored metal. They are arranged in a row, with ladders and walkways connecting them. The background shows a vast landscape with rolling hills under a sky filled with soft, pink and orange hues from a setting or rising sun.

# COMPARISON OF NATURAL SOURCE DEPLETION (NSZD) CHARACTERIZATION METHODS

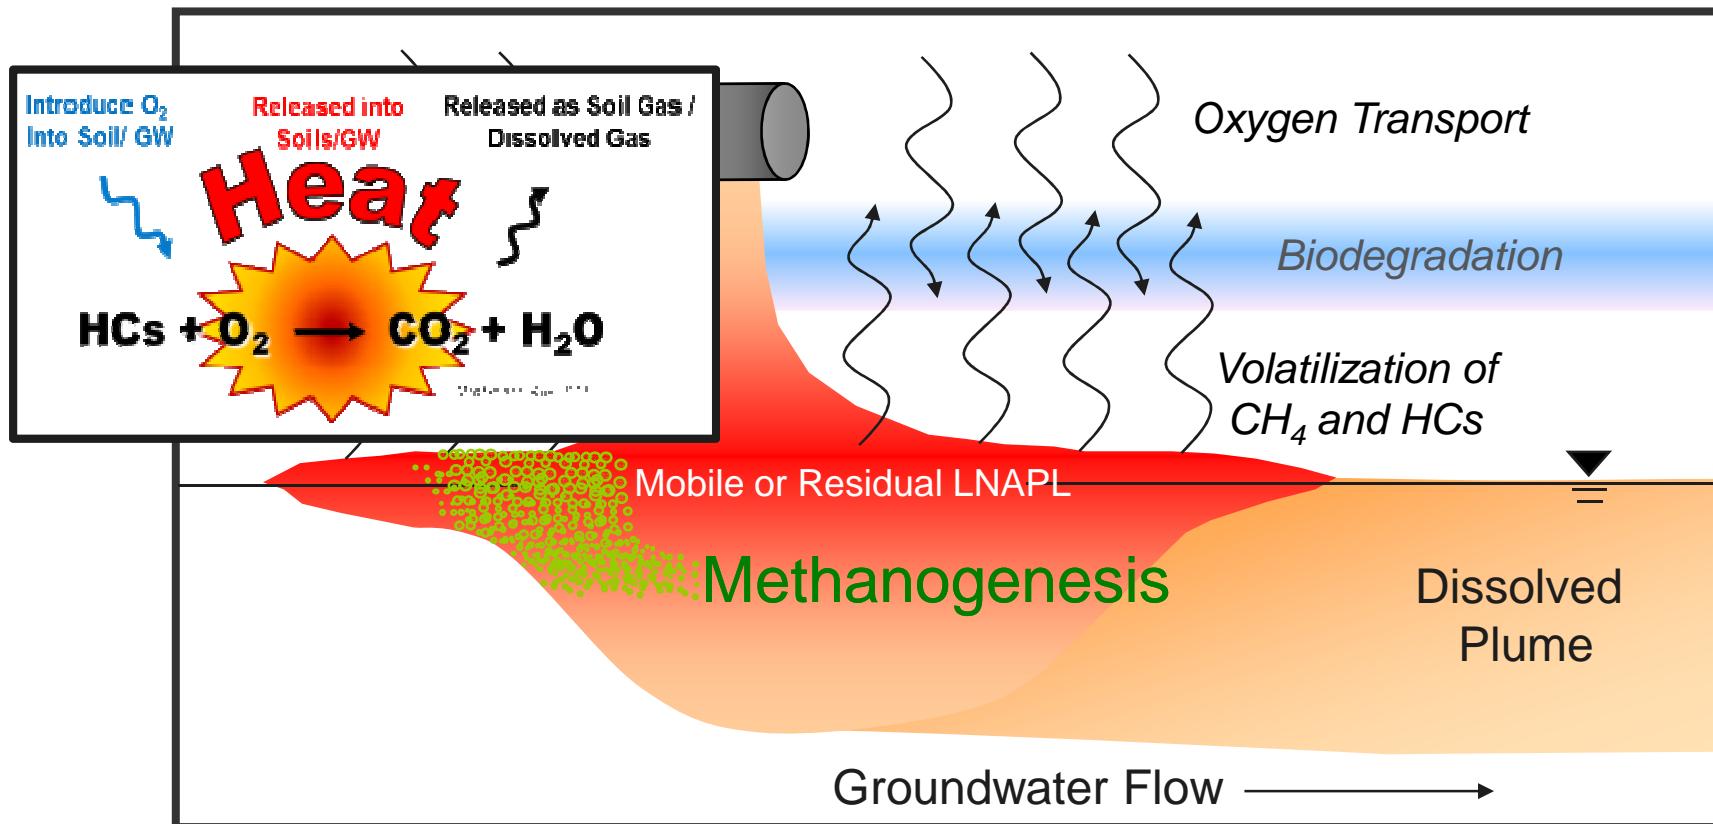

Mark Malander and Harley Hopkins (ExxonMobil)  
Andy Pennington, Jonathon Smith, and  
Steven Gaito (Arcadis)

November 2015

# Agenda

- Study Objectives
- Findings from each Method
- Comparison of NSZD Rates
- Temperature Observations
- Summary

# NSZD Processes in the Vadose Zone

**Mass loss occurs from:**

**Volatilization:** Observed from soil gas concentration data

**Biodegradation:** Inferred from oxygen, methane, and hydrocarbon soil gas depth profiles  
 $\text{CO}_2$  flux through groundsurface

or

# NSZD Methodology Comparison: Study Objectives

CO<sub>2</sub> Trap

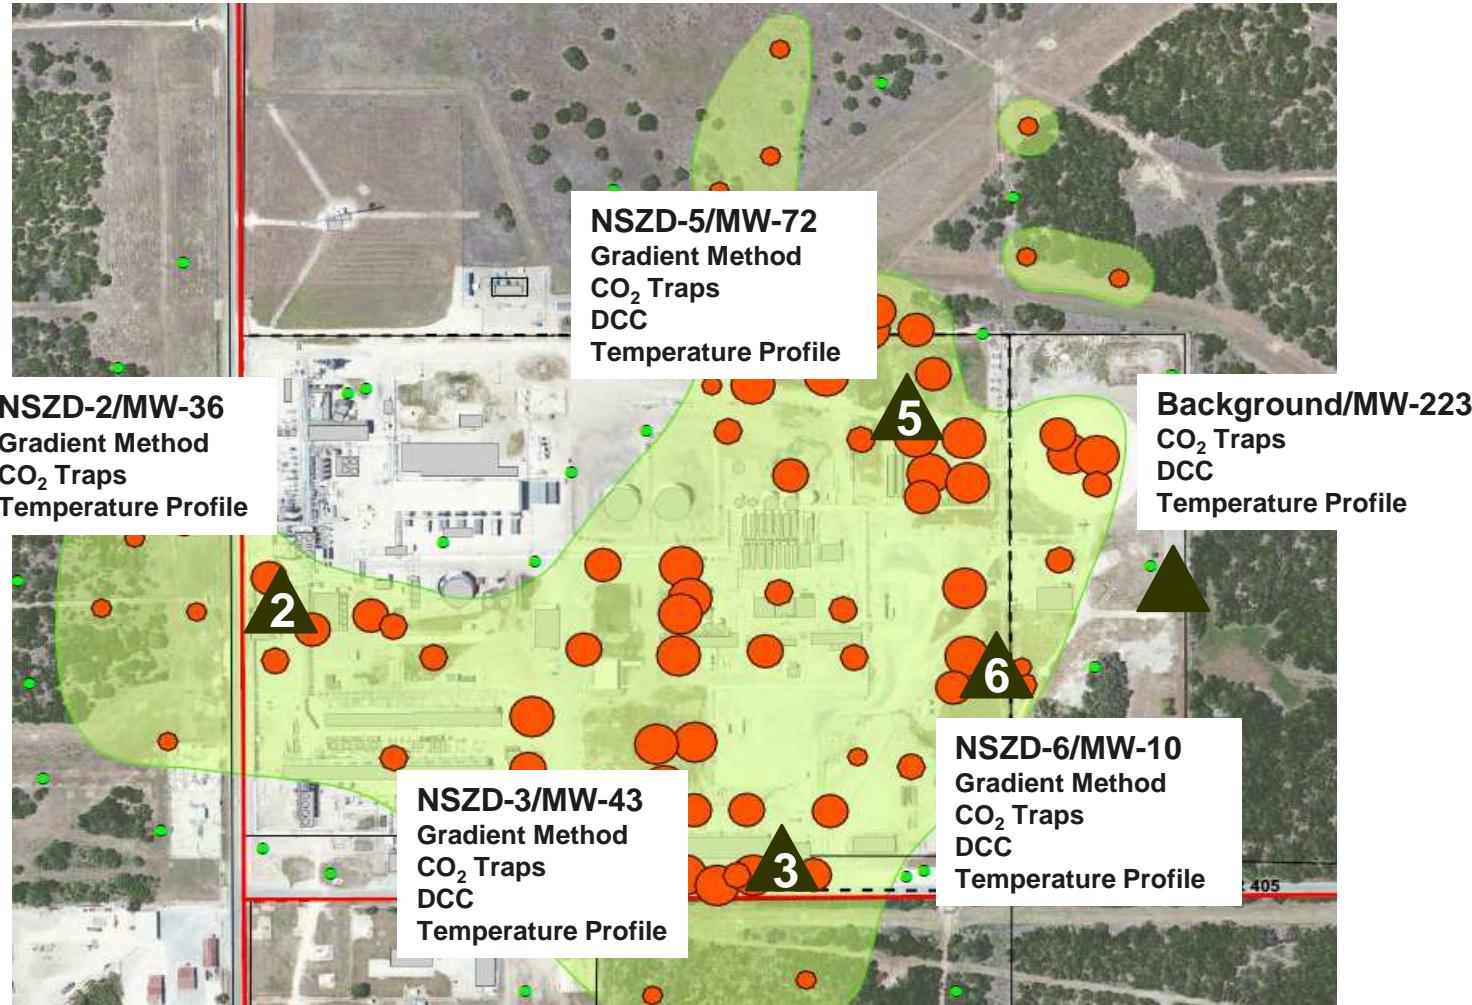

LI-COR Chamber and Analyzer

Temperature Datalogger

- Side-by-side comparison of NSZD quantification methods
- Gradient Method
- Dynamic Closed Chamber (DCC)
- CO<sub>2</sub> Traps
- Collect duplicate CO<sub>2</sub> trap data to evaluate repeatability
- Collect ancillary data:
  - Soil moisture
  - Rainfall from airport
  - Barometric pressure
  - Temperature profiles

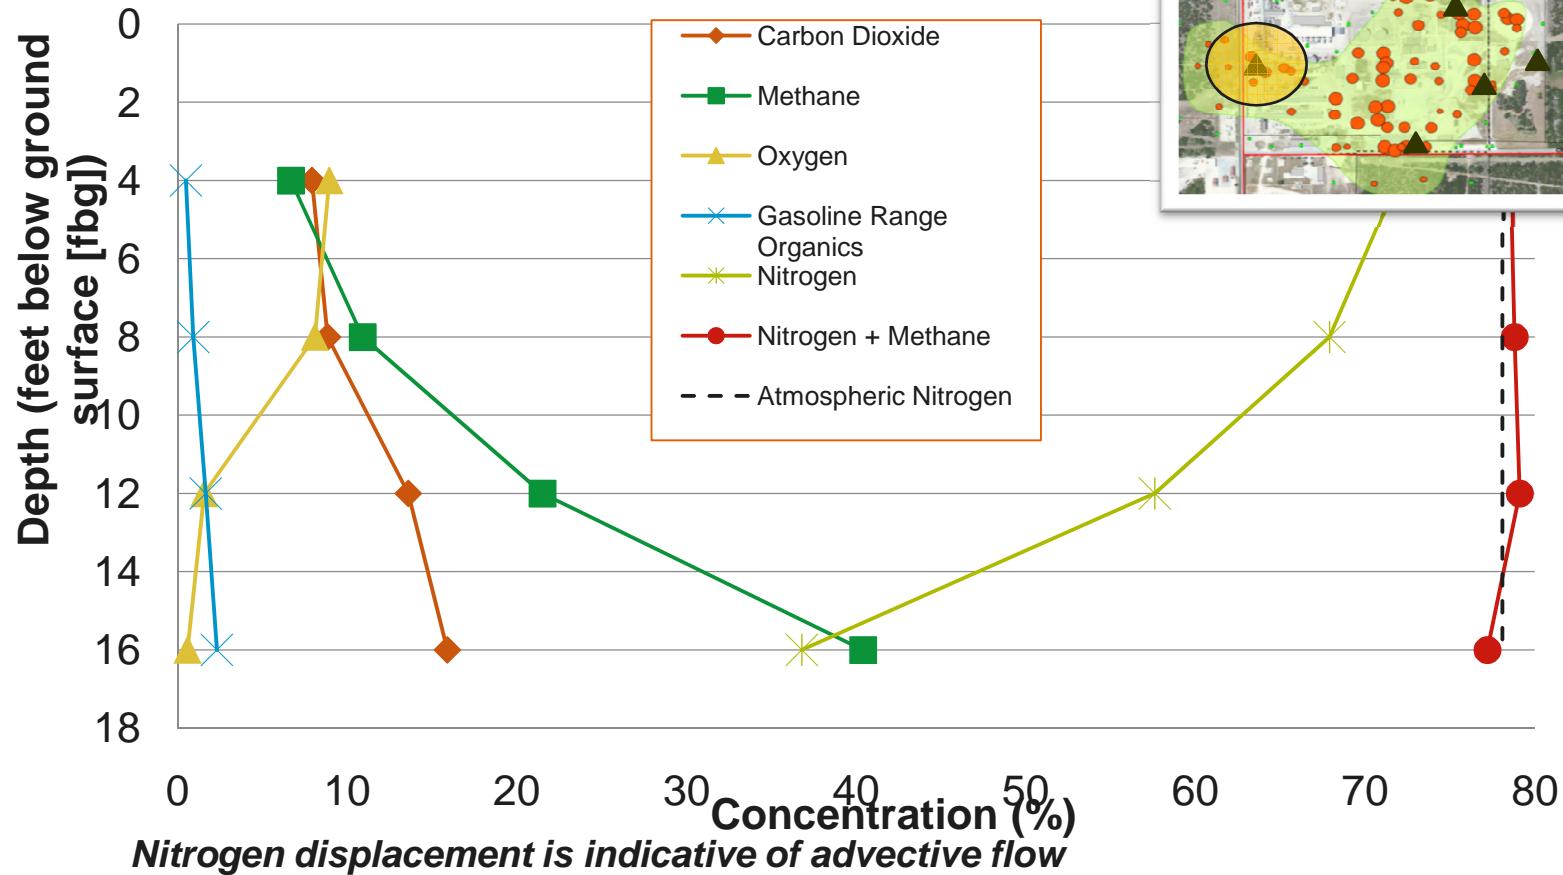

# Method Comparison Study Locations

# Gradient Method

# Gradient Method

## NSZD-2 Soil Gas Profile

# Vapor-Phase Porous Media Diffusion Coefficient

Location ID	$D_{eff}, O_2$ (cm <sup>2</sup> /sec)		Ratio
	March 2014	Aug 2012	
NSZD-2	0.0124	0.0071	1.75
NSZD-3	0.0084	0.0206	0.41
NSZD-5	0.0060	0.0085	0.70
NSZD-6	0.0042	0.0017	2.48

***Diffusion coefficient is dependent on pore fluid saturation***

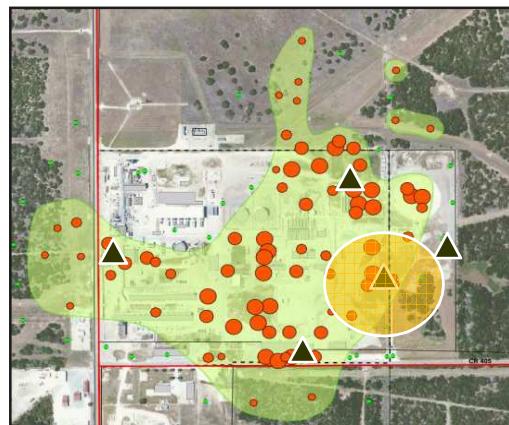

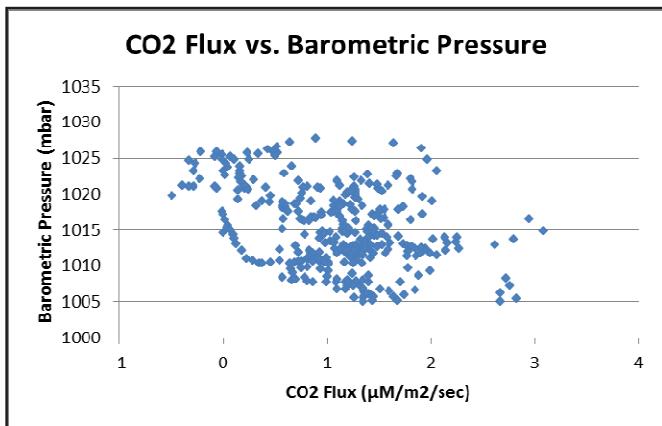

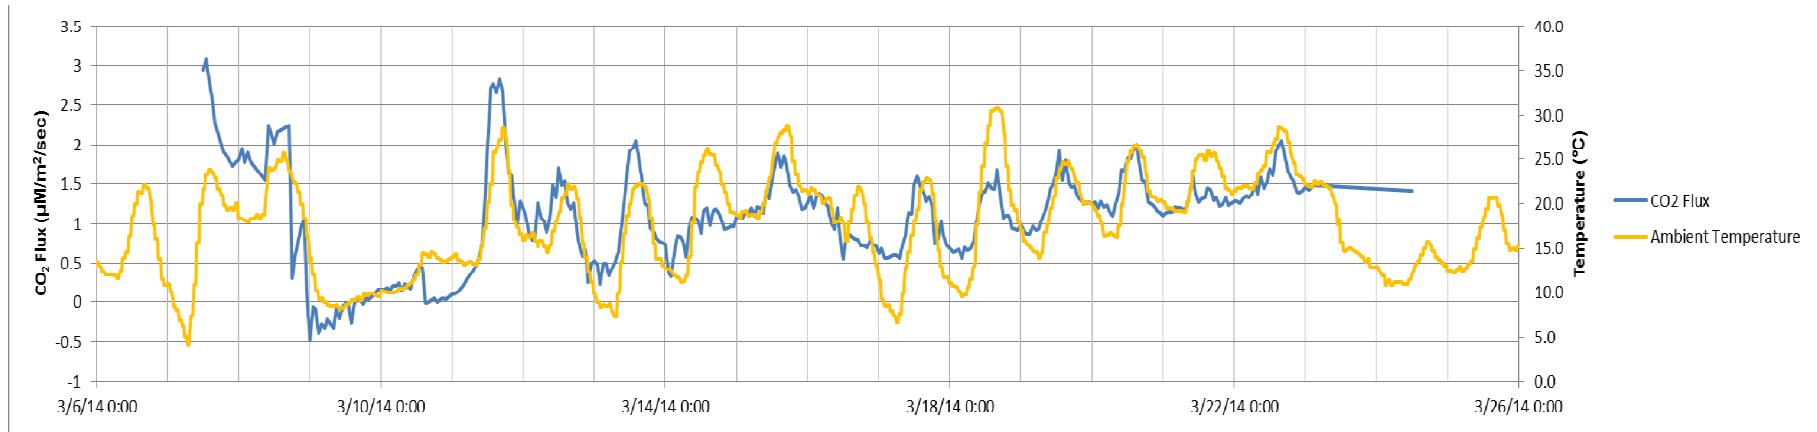

# CO<sub>2</sub> Flux Methods

# Dynamic Closed Chamber (DCC)

High-quality data, but demanding setup

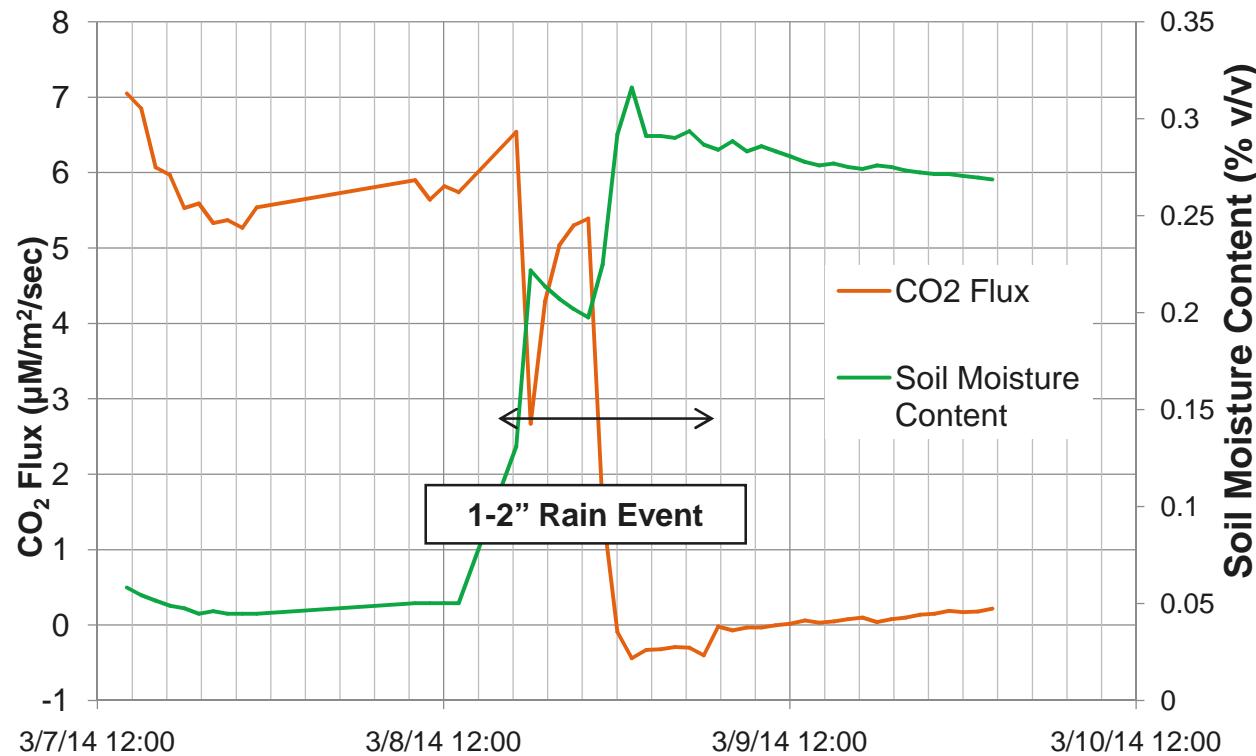

# CO<sub>2</sub> Flux Data (DCC): NSZD-6

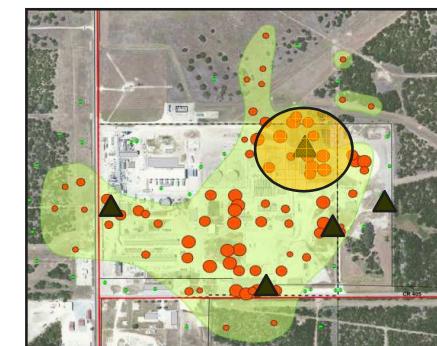

***Strong correlation between atmospheric temperature and flux***

# CO<sub>2</sub> Flux Data (DCC): NSZD-5

Effects of soil moisture/rainfall are significant

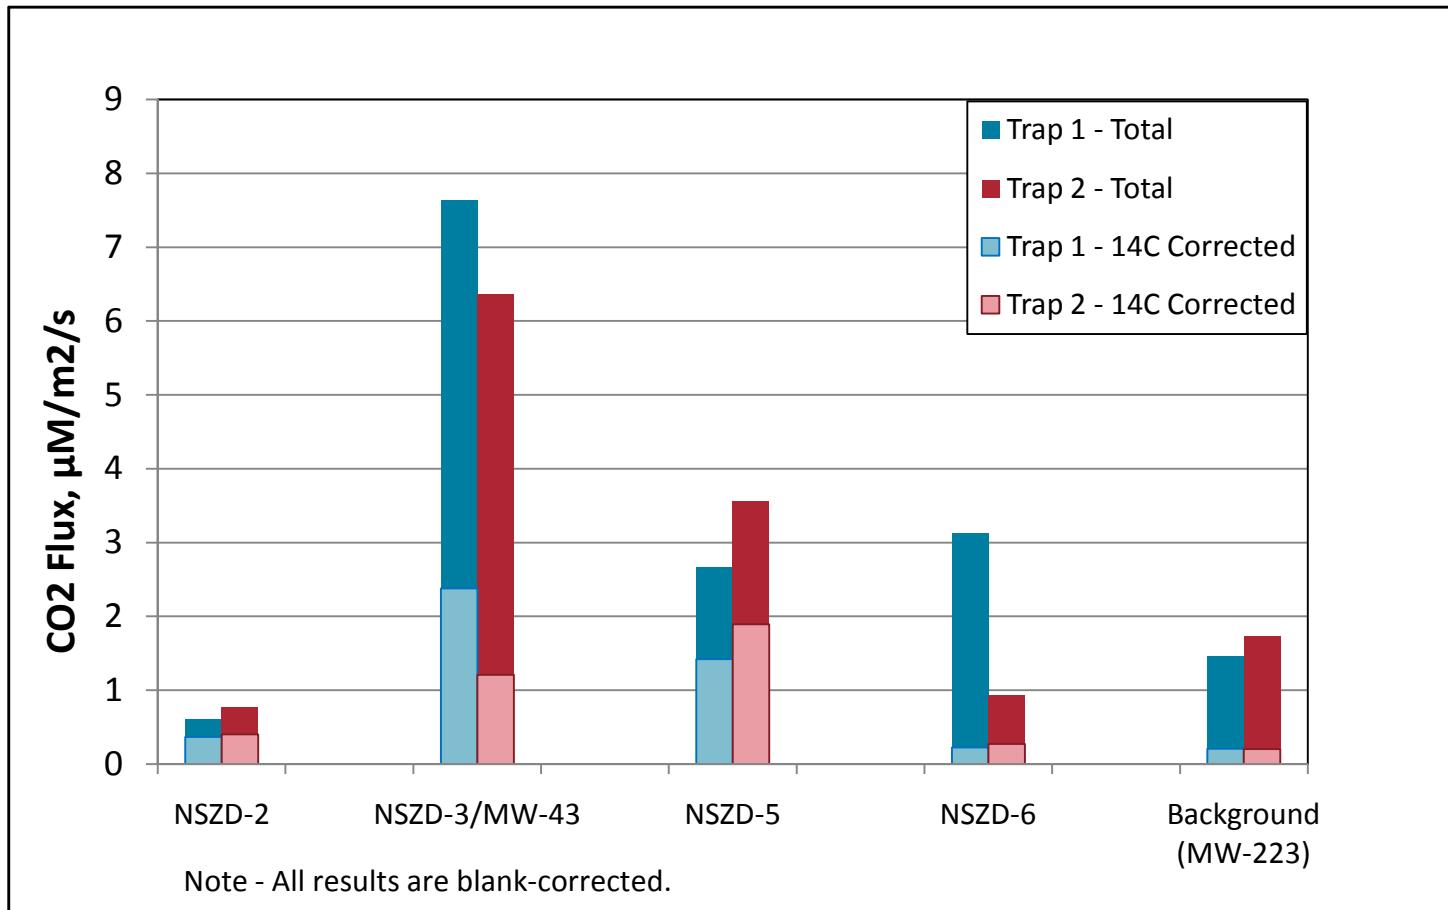

# CO<sub>2</sub> Traps

# CO<sub>2</sub> Trap Results

## Duplicate Comparison

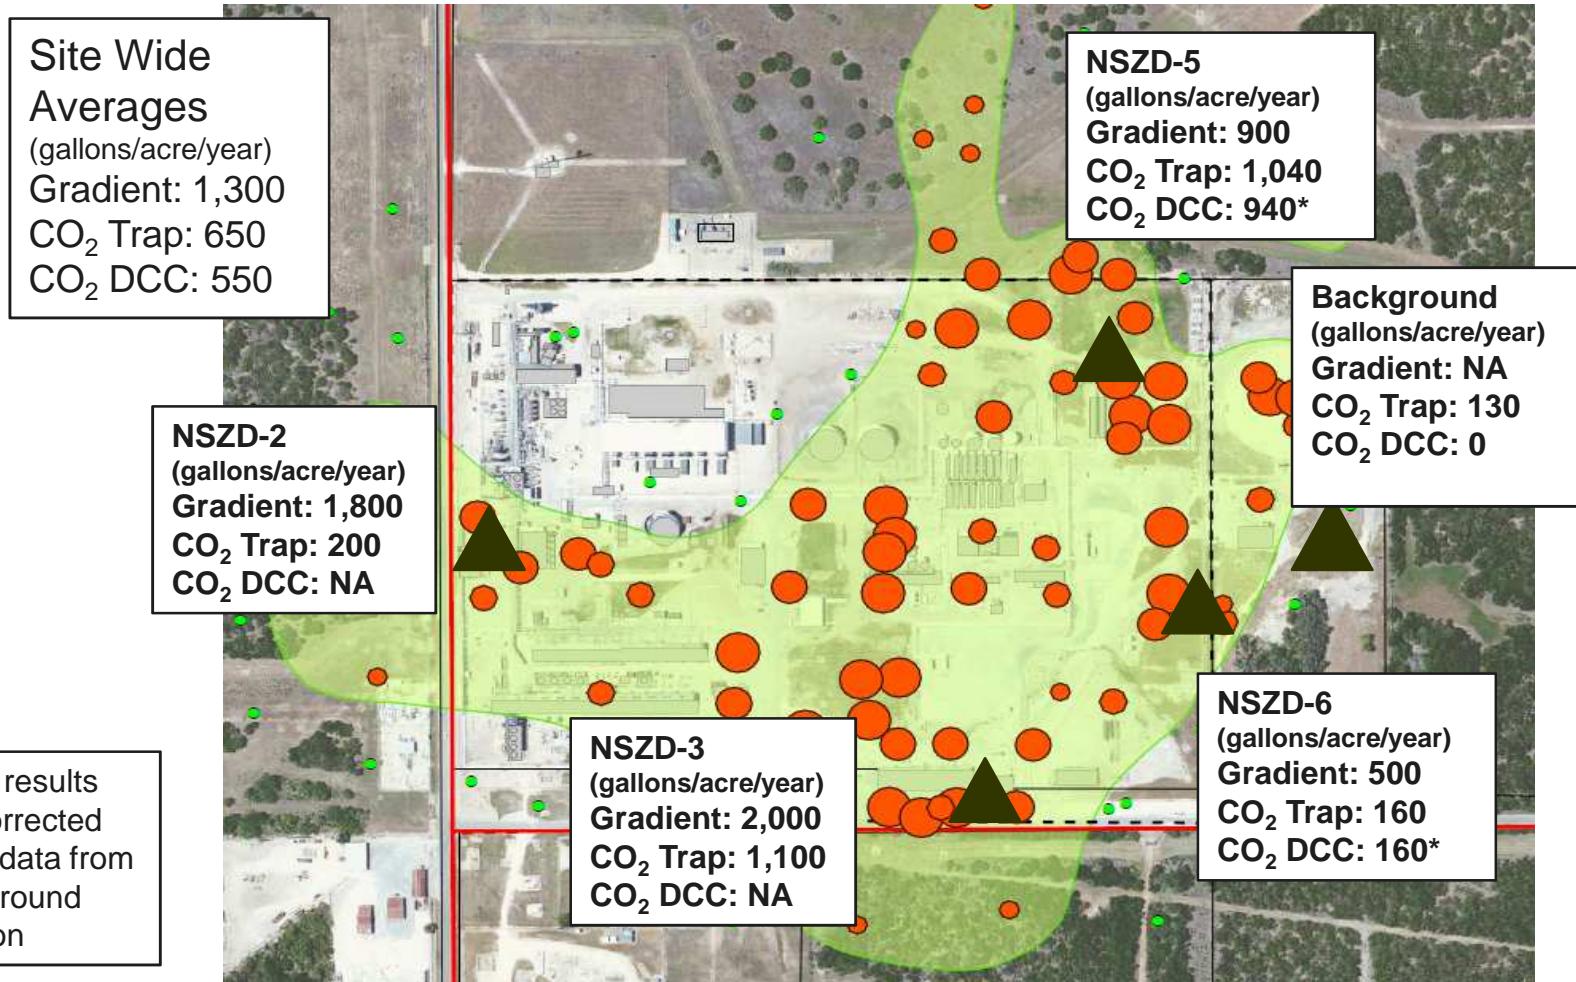

# CO<sub>2</sub> Trap Results

## Modern Carbon Flux

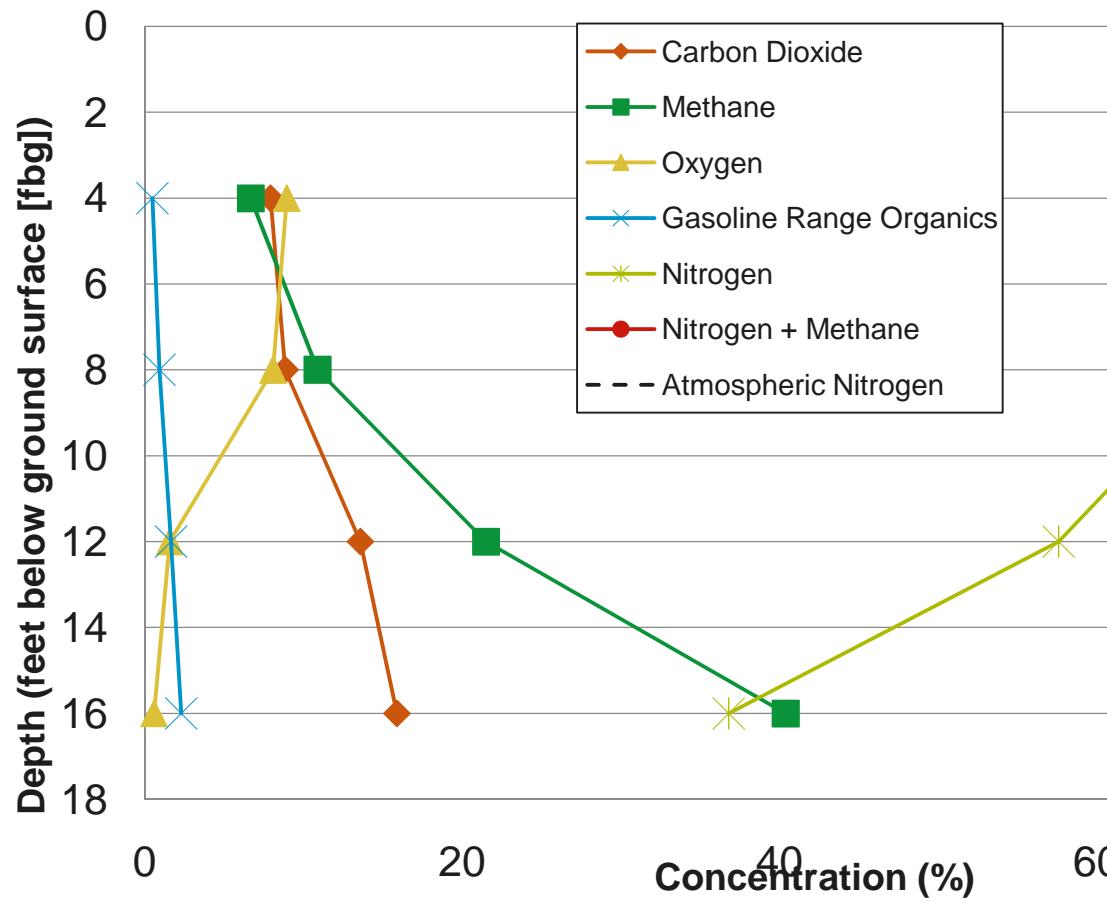

# Method Comparison Site Wide Average

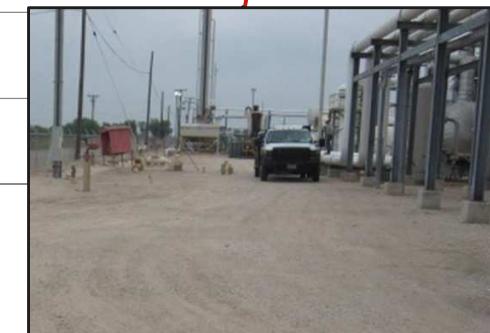

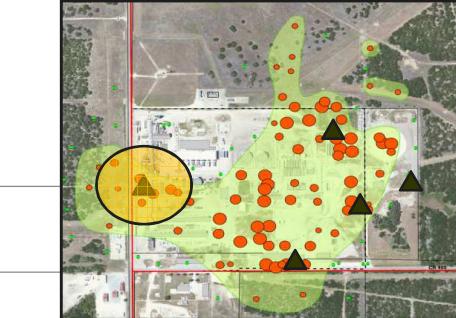

# Gradient Method

## NSZD-2 Soil Gas Profile

**NSZD-2**  
(gallons/acre/year)  
**Gradient: 1,800**  
**CO<sub>2</sub> Trap: 200**  
**CO<sub>2</sub> DCC: NA**

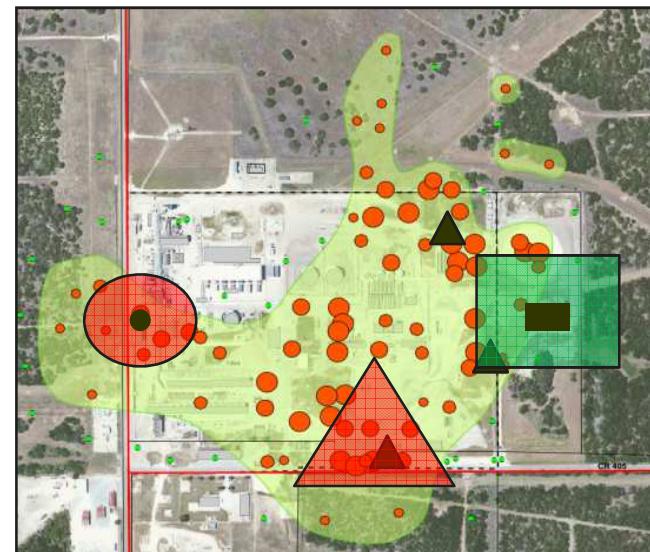

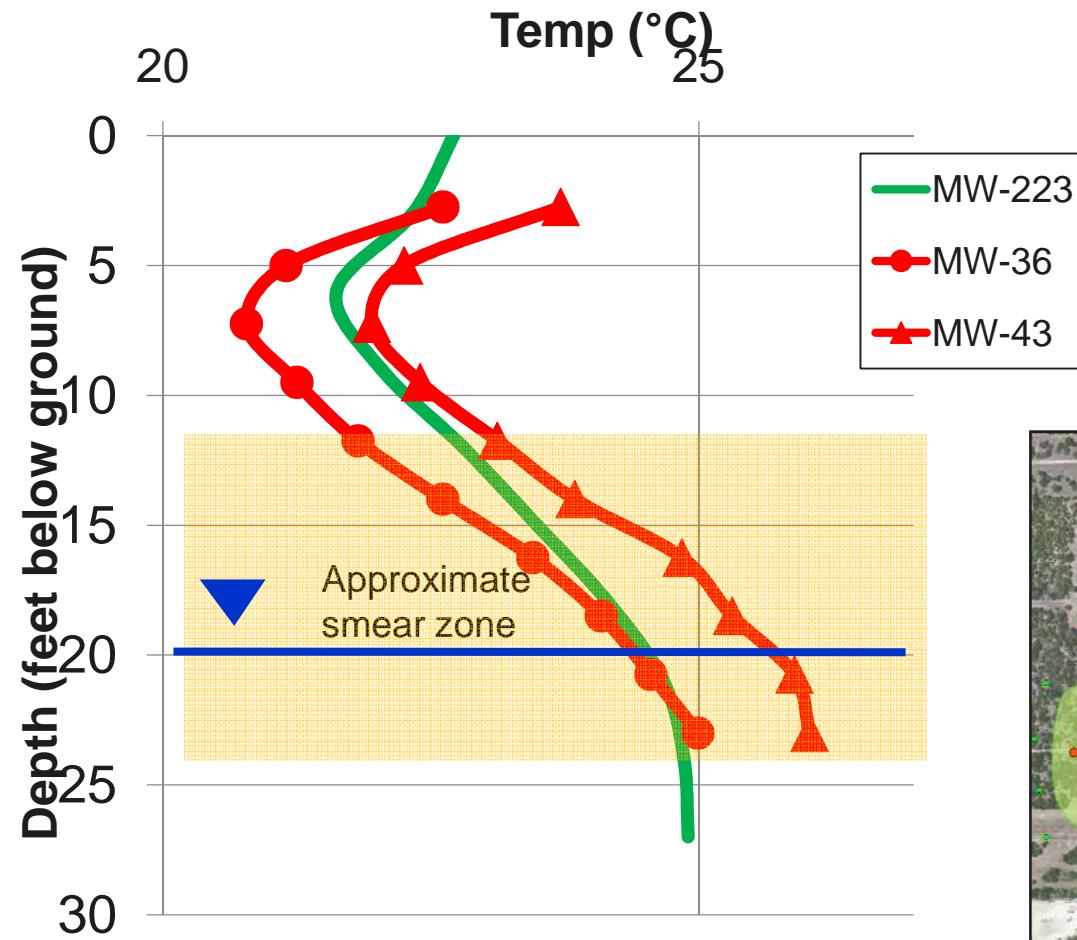

# Temperature Observations

# Temperature Observations

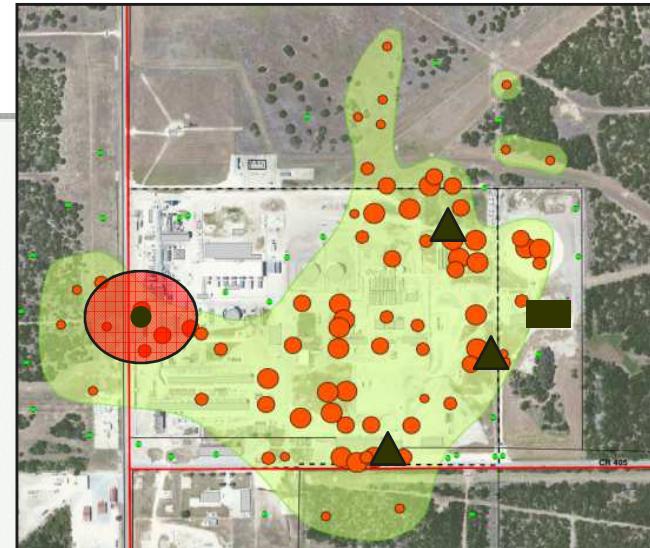

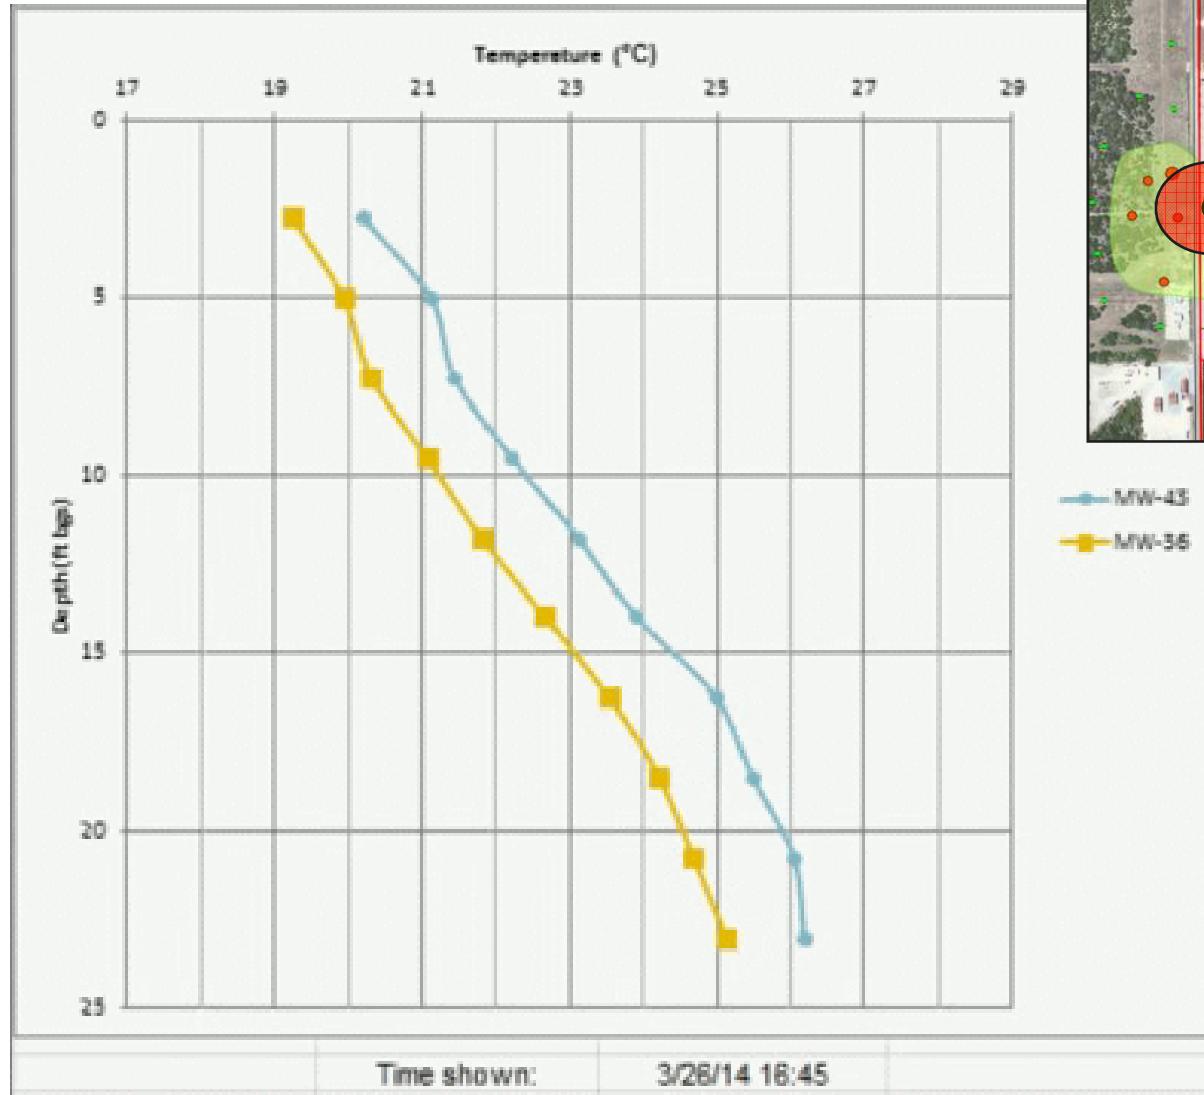

- Intrinsically safe temperature dataloggers set down-well at 2.5-foot to 3-foot intervals
- Temperature data logged every 15 minutes
- Data logging resolved downward propagation of temperature variation at surface

# Temperature Observations

# Temperature Profile

**ExxonMobil**

# Method Comparison Summary

	Capital Costs	Field Deployment Costs	Data Reliability	Qualitative Evidence	Data Density	Ease of Use	Best Application
Gradient Method	B	C	B	A	B	C	Sites with existing soil gas sampling infrastructure
CO <sub>2</sub> Traps	A	B	A	C	C	A	Well-understood sites with relatively uniform subsurface and climate conditions
LI-COR DCC	C	A	B	B	A	B	Initial screening of locations; Detailed rapid measurements; Investigating complex influences

**Notes:** Gradient method includes diffusion coefficient field measurement

Capital costs assume purchase of LI-COR DCC

A photograph of several large, cylindrical industrial storage tanks made of light-colored metal. One tank in the foreground has a prominent external staircase and walkway attached to its side. The sky above is a vibrant blue with scattered white and pinkish clouds, suggesting a sunset or sunrise. In the background, more tanks are visible, along with some industrial structures and a fence.

# QUESTIONS AND COMMENTS

Thank you!
